# **PART-III : MATHEMATICS**

# SECTION - 1 (Maximum Marks : 24)

- This section contains **SIX (06)** questions.
- Each question has **FOUR** options (A), (B), (C) and (D). **ONE OR MORE THAN ONE** of these four option(s) is (are) correct answer(s).
- For each question, choose the option(s) corresponding to (all) the correct answer(s).
- Answer to each question will be evaluated <u>according to the following marking scheme:</u>
  - Full Marks
     : +4
     If only (all) the correct option(s) is(are) chosen;
  - *Partial Marks* : +3 If all the four options are correct but ONLY three options are chosen;
  - Partial Marks : +2 If three or more options are correct but ONLY two options are chosen, both of which are correct;
  - *Partial Marks* : +1 If two or more options are correct but ONLY one option is chosen and it is a correct option;
  - Zero Marks : 0 If unanswered;
  - *Negative Marks* : 2 In all other cases.
- For example, in a question, if (A), (B) and (D) are the ONLY three options corresponding to correct answers, then choosing ONLY (A), (B) and (D) will get +4 marks;
  - choosing ONLY (A) and (B) will get +2 marks;
  - choosing ONLY (A) and (D) will get +2 marks;
  - choosing ONLY (B) and (D) will get +2 marks;
  - choosing ONLY (A) will get +1 mark;
  - choosing ONLY (B) will get +1 mark;
  - choosing ONLY (D) will get +1 mark;

choosing no option(s) (i.e. the question is unanswered) will get 0 marks and

choosing any other option(s) will get "2 marks.

1. Let  $S_1 = \{(i, j, k) : i, j, k \in \{1, 2, ..., 10\}\},\$ 

 $S_2 = \{(i, j) : 1 \le i < j + 2 \le 10, i, j \in \{1, 2, \dots, 10\}\},\$ 

$$S_3 = \{(i, j, k, l) : 1 \le i < j < k < l, i, j, k, l \in \{1, 2, ..., 10\}\},\$$

and

 $S_4 = \{(i, j, k, l) : i, j, k \text{ and } l \text{ are distinct elements in } \{1, 2, ..., 10\}\}.$ 

If the total number of elements in the set  $S_r$  is  $n_r$ , r = 1, 2, 3, 4, then which of the following statements is (are) TRUE?

- (A)  $n_1 = 1000$  (B)  $n_2 = 44$
- (C)  $n_3 = 220$  (D)  $\frac{n_4}{12} = 420$

### Answer (A,B,D)

**Sol.** Number of elements in  $S_1 = 10 \times 10 \times 10 = 1000$ Number of elements in  $S_2 = 9 + 8 + 7 + 6 + 5 + 4 + 3 + 2 = 44$ Number of elements in  $S_3 = {}^{10}C_4 = 210$ Number of elements in  $S_4 = {}^{10}P_4 = 210 \times 4! = 5040$  2. Consider a triangle *PQR* having sides of lengths *p*,*q* and *r* opposite to the angles *P*, *Q* and *R*, respectively. Then which of the following statements is (are) TRUE ?

(A) 
$$\cos P \ge 1 - \frac{p^2}{2qr}$$
  
(B)  $\cos R \ge \left(\frac{q-r}{p+q}\right) \cos P + \left(\frac{p-r}{p+q}\right) \cos Q$   
(C)  $\frac{q+r}{p} < 2 \frac{\sqrt{\sin Q \sin R}}{\sin P}$ 

(D) If 
$$p < q$$
 and  $p < r$ , then  $\cos Q > \frac{p}{r}$  and  $\cos R > \frac{p}{q}$ 

$$= \cos R + \frac{r-q-p}{p+q} \le \cos R \quad (\because r < p+q)$$

(C) 
$$\frac{q+r}{p} = \frac{\sin Q + \sin R}{\sin P} \ge \frac{2\sqrt{\sin Q \cdot \sin R}}{\sin P}$$

(D) If p < q and q < r

So, p is the smallest side, therefore one of Q or R can be obtuse

So, one of cosQ or cosR can be negative

Therefore  $\cos Q > \frac{p}{r}$  and  $\cos R > \frac{p}{q}$  cannot hold always.

3. Let  $f:\left[-\frac{\pi}{2},\frac{\pi}{2}\right] \to \mathbb{R}$  be a continuous function such that f(0) = 1 and  $\int_{0}^{\frac{\pi}{3}} f(t)dt = 0$ Then which of the following statements is (are) TRUE?

- (A) The equation  $f(x) 3\cos 3x = 0$  has at least one solution in  $\left(0, \frac{\pi}{3}\right)$
- (B) The equation  $f(x) 3\sin 3x = -\frac{6}{\pi}$  has at least one solution in  $\left(0, \frac{\pi}{3}\right)$

(C) 
$$\lim_{x \to 0} \frac{x \int_{0}^{x} f(t) dt}{1 - e^{x^{2}}} = -1$$
  
(D) 
$$\lim_{x \to 0} \frac{\sin x \int_{0}^{x} f(t) dt}{x^{2}} = -1$$

Answer (A,B,C)

**Sol.** 
$$f(0) = 1$$
,  $\int_0^{\frac{\pi}{3}} f(t) dt = 0$ 

(A) Consider a function  $g(x) = \int_0^x f(t) dt - \sin 3x$ 

g(x) is continuous and differentiable function and g(0) = 0

$$g\left(\frac{\pi}{3}\right) = 0$$

By Rolle's theorem g'(x) = 0 has at least one solution in  $\left(0, \frac{\pi}{3}\right)$ 

$$f(x) - 3\cos 3x = 0$$
 for some  $x \in \left(0, \frac{\pi}{3}\right)$ 

(B) Consider a function

$$h(x) = \int_0^x f(t)dt + \cos 3x + \frac{6}{\pi}x$$

h(x) is continuous and differentiable function

and h(0) = 1

$$h\left(\frac{\pi}{3}\right) = 1$$

By Rolle's theorem h'(x) = 0 for at least one  $x \in \left(0, \frac{\pi}{3}\right)$ 

$$f(x) - 3\sin 3x + \frac{6}{\pi} = 0$$
 for some  $x \in \left(0, \frac{\pi}{3}\right)$ 

(C) 
$$\lim_{x \to 0} \frac{x \int_0^x f(t) dt}{1 - e^{x^2}} , \left(\frac{0}{0} \text{ form}\right)$$

By L' Hopital rule

$$\lim_{x \to 0} \frac{xf(x) + \int_{0}^{x} f(t)dt}{-2xe^{x^{2}}}, \left(\frac{0}{0} \text{ form}\right)$$

$$= \lim_{x \to 0} \frac{xf'(x) + f(x) + f(x)}{-4x^{2}e^{x^{2}} - 2e^{x^{2}}} = \frac{0 + 2f(0)}{-0 - 2} = -1$$
(D) 
$$\lim_{x \to 0} \frac{\sin x \int_{0}^{x} f(t)dt}{x^{2}}, \left(\frac{0}{0} \text{ form}\right)$$

$$= \lim_{x \to 0} \frac{\sin x \cdot f(x) + \cos x \int_{0}^{x} f(t)dt}{2x}$$

$$= \lim_{x \to 0} \frac{\left(\cos x \cdot f(x) + \sin x \cdot f'(x) + \cos x \cdot f(x) - \sin x \cdot \int_{0}^{x} f(t)dt\right)}{2}$$

$$= \frac{1 + 0 + 1 - 0}{2}$$

- 4. For any real numbers  $\alpha$  and  $\beta$ , let  $y_{\alpha\beta}(x)$ ,  $x \in \mathbb{R}$ , be the solution of the differential equation  $\frac{dy}{dx} + \alpha y = xe^{\beta x}$ , y(1) = 1
  - Let  $S = \{y_{\alpha,\beta}(x) : \alpha, \beta \in \mathbb{R}\}$ . Then which of the following functions belong(s) to the set S?

(A) 
$$f(x) = \frac{x^2}{2}e^{-x} + \left(e - \frac{1}{2}\right)e^{-x}$$
  
(B) 
$$f(x) = -\frac{x^2}{2}e^{-x} + \left(e + \frac{1}{2}\right)e^{-x}$$
  
(C) 
$$f(x) = \frac{e^x}{2}\left(x - \frac{1}{2}\right) + \left(e - \frac{e^2}{4}\right)e^{-x}$$
  
(D) 
$$f(x) = \frac{e^x}{2}\left(\frac{1}{2} - x\right) + \left(e + \frac{e^2}{4}\right)e^{-x}$$
  

$$\overline{Answer (A, C)}$$
  
Sol. 
$$\frac{dy}{dx} + \alpha y = xe^{\beta x}$$
  
Integrating factor (I.F.) = 
$$e^{\int \alpha dx} = e^{\alpha x}$$
  
So, the solution is  $y \cdot e^{\alpha x} = \int xe^{\beta x} \cdot e^{\alpha x} dx$   

$$ye^{\alpha x} = \int xe^{(\alpha + \beta)x} dx$$
  
If  $\alpha + \beta \neq 0$ 

$$ye^{\alpha x} = x \frac{e^{(\alpha+\beta)x}}{(\alpha+\beta)} - \frac{e^{(\alpha+\beta)x}}{(\alpha+\beta)^2} + C$$

$$y = \frac{xe^{\beta x}}{(\alpha+\beta)} - \frac{e^{\beta x}}{(\alpha+\beta)^2} + Ce^{-\alpha x}$$

$$y = \frac{e^{\beta x}}{(\alpha+\beta)} \left(x - \frac{1}{\alpha+\beta}\right) + Ce^{-\alpha x} \qquad \dots (i)$$
Put  $\alpha = \beta = 1$  in (i)
$$y = \frac{e^x}{2} \left(x - \frac{1}{2}\right) + Ce^{-x}$$

$$y(1) = 1$$

$$1 = \frac{e}{2} \times \frac{1}{2} + \frac{C}{e} \Rightarrow C = e - \frac{e^2}{4}$$
So,  $y = \frac{e^x}{2} \left(x - \frac{1}{2}\right) + \left(e - \frac{e^2}{4}\right)e^{-x}$ 
If  $\alpha + \beta = 0$  &  $\alpha = 1$ 

$$\frac{dy}{dx} + y = xe^{-x}$$
I.F.  $= e^x$ 

$$ye^x = \int xdx$$

$$ye^x = \frac{x^2}{2} + C$$

$$y = \frac{x^2}{2}e^{-x} + Ce^{-x}$$

$$y(1) = 1$$

$$1 = \frac{1}{2e} + \frac{C}{e} \Rightarrow C = e - \frac{1}{2}$$

$$y = \frac{x^2}{2}e^{-x} + \left(e - \frac{1}{2}\right)e^{-x}$$

5. Let O be the origin and  $\overrightarrow{OA} = 2\hat{i} + 2\hat{j} + \hat{k}$ ,  $\overrightarrow{OB} = \hat{i} - 2\hat{j} + 2\hat{k}$  and  $\overrightarrow{OC} = \frac{1}{2}(\overrightarrow{OB} - \lambda\overrightarrow{OA})$  for some  $\lambda > 0$ . If

 $\left|\overrightarrow{OB} \times \overrightarrow{OC}\right| = \frac{9}{2}$ , then which of the following statements is (are) TRUE ?

- (A) Projection of  $\overrightarrow{OC}$  on  $\overrightarrow{OA}$  is  $-\frac{3}{2}$
- (B) Area of the triangle *OAB* is  $\frac{9}{2}$
- (C) Area of the triangle ABC is  $\frac{9}{2}$
- (D) The acute angle between the diagonals of the parallelogram with adjacent sides  $\overrightarrow{OA}$  and  $\overrightarrow{OC}$  is  $\frac{\pi}{3}$

Answer (A,B,C)

JEE (ADVANCED)-2021 (Paper-2)

Sol. 
$$OA = 2\hat{i} + 2\hat{j} + \hat{k}$$
  
 $\overline{OB} = \hat{i} - 2\hat{j} + 2\hat{k}$   
 $\overline{OC} = \frac{1}{2}(\overline{OB} - \lambda\overline{OA})$   
 $\overline{OB} \times \overline{OC} = \overline{OB} \times \frac{1}{2}(\overline{OB} - \lambda\overline{OA}) = -\frac{\lambda}{2}\overline{OB} \times \overline{OA} = \frac{\lambda}{2}(\overline{OA} \times \overline{OB})$   
Now,  $\overline{OA} \times \overline{OB} = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 2 & 2 & 1 \\ 1 & -2 & 2 \end{vmatrix} = 6\hat{i} - 3\hat{j} - 6\hat{k}$   
So,  $\overline{OB} \times \overline{OC} = \frac{3\lambda}{2}(2\hat{i} - \hat{j} - 2\hat{k})$   
 $\left|\overline{OB} \times \overline{OC}\right| = \left|\frac{9\lambda}{2}\right| = \frac{9}{2}$   
So,  $\lambda = 1$  ( $\because \lambda > 0$ )  
 $\overline{OC} = \frac{1}{2}(\overline{OB} - \overline{OA})$   
 $\overline{OC} = \frac{1}{2}(-\hat{i} - 4\hat{j} + \hat{k})$   
(A) Projection of  $\overline{OC}$  on  $\overline{OA} = \frac{\overline{OC} \cdot \overline{OA}}{|\overline{OA}|} = \frac{\frac{1}{2}(-2 - 8 + 1)}{3} = -\frac{3}{2}$   
(B) Area of the triangle  $OAB = \frac{1}{2}|\overline{OA} \times \overline{OB}| = \frac{9}{2}$ 

(C) Area of the triangle ABC is 
$$=\frac{1}{2}\left|\overrightarrow{AB}\times\overrightarrow{AC}\right| = \frac{1}{2}\left|\begin{vmatrix}\hat{i} & \hat{j} & \hat{k}\\ -1 & -4 & 1\\ -\frac{5}{2} & -4 & -\frac{1}{2}\end{vmatrix}\right| = \frac{1}{2}\left|6\hat{i}-3\hat{j}-6\hat{k}\right| = \frac{9}{2}$$

(D) Acute angle between the diagonals of the parallelogram with adjacent sides  $\overrightarrow{OA}$  and  $\overrightarrow{OC} = \theta$ 

$$\frac{(\overrightarrow{OA} + \overrightarrow{OC}) \cdot (\overrightarrow{OA} - \overrightarrow{OC})}{\left| \overrightarrow{OA} + \overrightarrow{OC} \right| \left| \overrightarrow{OA} - \overrightarrow{OC} \right|} = \cos \theta$$

$$\cos \theta = \frac{\left( \frac{3}{2}\hat{i} + \frac{3}{2}\hat{k} \right) \left( \frac{5}{2}\hat{i} + 4\hat{j} + \frac{1}{2}\hat{k} \right)}{\frac{3}{2}\sqrt{2} \times \sqrt{\frac{90}{4}}} = \frac{18}{3\sqrt{2}\sqrt{90}}$$

$$\theta \neq \frac{\pi}{3}$$

- 6. Let *E* denote the parabola  $y^2 = 8x$ . Let P = (-2, 4), and let *Q* and *Q'* be two distinct points on *E* such that the lines *PQ* and *PQ'* are tangents to *E*. Let *F* be the focus of *E*. Then which of the following statements is (are) TRUE ?
  - (A) The triangle *PFQ* is a right-angled triangle
  - (B) The triangle QPQ' is a right-angled triangle
  - (C) The distance between *P* and *F* is  $5\sqrt{2}$
  - (D) F lies on the line joining Q and Q'

Answer (A,B,D) Sol.  $E: y^2 = 8x$ P: (-2, 4)P(-2,4)

Point P (-2, 4) lies on directrix (x = -2) of parabola  $y^2 = 8x$ 

So,  $\angle QPQ' = \frac{\pi}{2}$  and chord QQ' is a focal chord and segment PQ subtends right angle at the focus. Slope of  $QQ' = \frac{2}{t_1 + t_2} = 1$ Slope of PF = -1

 $PF = 4\sqrt{2}$ 

x = -2

# SECTION - 2 (Maximum Marks : 12)

- This section contains **THREE (03)** question stems.
- There are TWO (02) questions corresponding to each question stem.
- The answer to each question is a NUMERICAL VALUE.
- For each question, enter the correct numerical value corresponding to the answer in the designated place using the mouse and the on-screen virtual numeric keypad.
- If the numerical value has more than two decimal places, truncate/round-off the value to TWO decimal places.
- Answer to each question will be evaluated according to the following marking scheme:

Full Marks	:	+2	If ONLY the correct numerical value is entered.
Zero Marks		0	In all other cases

# **Question Stem for Question Nos. 7 and 8**

Consider the region  $R = \{(x, y) \in \mathbb{R} \times \mathbb{R} : x \ge 0 \text{ and } y^2 \le 4 - x\}$ . Let *F* be the family of all circles that are contained in *R* and have centers on the *x*-axis. Let *C* be the circle that has largest radius among the circles in *F*. Let  $(\alpha, \beta)$  be a point where the circle *C* meets the curve  $y^2 = 4 - x$ .

### 7. The radius of the circle C is \_\_\_\_\_.

Answer (1.50)

8. The value of  $\alpha$  is \_\_\_\_\_.

Answer (2.00)

Sol. For comprehension Q7 & Q8

Let the circle be,

 $(x-a)^2 + y^2 = r^2$ 

Solving it with parabola

 $y^{2} = 4 - x \text{ we get}$   $(x - a)^{2} + 4 - x = r^{2}$   $\Rightarrow x^{2} - x(2a + 1) + (a^{2} + 4 - r^{2}) = 0 \qquad \dots(1)$  D = 0  $\Rightarrow 4r^{2} + 4a - 15 = 0$ Clearly  $a \ge r$ So  $4r^{2} + 4r - 15 \le 0$   $\Rightarrow r_{max} = \frac{3}{2} = a$ Radius of circle *C* is  $\frac{3}{2}$ From (1)  $x^{2} - 4x + 4 = 0$   $\Rightarrow x = 2 = \alpha$ 

#### Question Stem for Question Nos. 9 and 10

Let  $f_1: (0, \infty) \to \mathbb{R}$  and  $f_2: (0, \infty) \to \mathbb{R}$  be defined by  $f_1(x) = \int_0^x \prod_{j=1}^{21} (t-j)^j dt, x > 0$ 

and  $f_2(x) = 98(x-1)^{50} - 600(x-1)^{49} + 2450$ , x > 0, where, for any positive integer *n* and real number  $a_1, a_2,...a_n$ ,  $\prod_{i=1}^n a_i$  denotes the product of  $a_1, a_2,...a_n$ . Let  $m_i$  and  $n_i$ , respectively, denote the number of points of local minima and the number of points of local maxima of function  $f_i$ , i = 1, 2, in the interval  $(0, \infty)$ .

#### Solution for Q9 and 10

$$f'_{1}(x) = \prod_{j=1}^{21} (x-j)^{j}$$

$$f'_{1}(x) = (x-1)(x-2)^{2}(x-3)^{3},..., (x-20)^{20}(x-21)^{21}$$
Checking the sign scheme of  $f'_{1}(x)$  at  $x = 1, 2, 3, ..., 21$ , we get
$$f_{1}(x)$$
 has local minima at  $x = 1, 5, 9, 13, 17, 21$  and local maxima at  $x = 3, 7, 11, 15, 19$ 

$$\Rightarrow m_{1} = 6, n_{1} = 5$$

$$f_{2}(x) = 98(x-1)^{50} - 600(x-1)^{49} + 2450$$

$$f'_{2}(x) = 98 \times 50(x-1)^{49} - 600 \times 49 \times (x-1)^{48}$$

$$= 98 \times 50 \times (x-1)^{48} (x-7)$$

$$f_{2}(x)$$
 has local minimum at  $x = 7$  and no local maximum.
$$\Rightarrow m_{2} = 1, n_{2} = 0$$
9. The value of  $2m_{1} + 3n_{1} + m_{1}n_{1}$  is \_\_\_\_\_.

**Sol.** 
$$2m_1 + 3n_1 + m_1n_1$$
  
= 2 × 6 + 3 × 5 + 6 × 5  
= 57

The value of  $6m_2 + 4n_2 + 8m_2n_2$  is \_\_\_\_\_. 10.

Answer (06.00)

9.

**Sol.** 
$$6m_2 + 4n_2 + 8m_2n_2$$
  
= 6 × 1 + 4 × 0 + 8 × 1 × 0 = 6

### Question Stem for Question Nos. 11 and 12

Let  $g_i: \left[\frac{\pi}{8}, \frac{3\pi}{8}\right] \rightarrow \mathbb{R}, i = 1, 2, \text{ and } f: \left[\frac{\pi}{8}, \frac{3\pi}{8}\right] \rightarrow \mathbb{R}$  be functions such that  $g_1(x) = 1, g_2(x) = |4x - \pi|$  and  $f(x) = \frac{3\pi}{8}$ sin<sup>2</sup>x, for all  $x \in \left[\frac{\pi}{8}, \frac{3\pi}{8}\right]$ . Define  $S_i = \int_{\frac{\pi}{2}}^{\frac{3\pi}{8}} f(x) \cdot g_i(x) dx$ , i = 1, 2

The value of  $\frac{16S_1}{\pi}$  is \_\_\_\_\_. 11.

Answer (U2. Sol.  $S_1 = \int_{\frac{\pi}{8}}^{\frac{3\pi}{8}} \sin^2 x \cdot 1 dx$  $=\frac{1}{2}\int_{\frac{\pi}{2}}^{\frac{3\pi}{8}}(1-\cos 2x)dx$ 

$$= \frac{1}{2} \left( x - \frac{\sin 2x}{2} \right)_{\frac{\pi}{8}}^{\frac{3\pi}{8}}$$

$$S_{1} = \frac{1}{2} \left( \frac{\pi}{4} - 0 \right) = \frac{\pi}{8}$$

$$\Rightarrow \frac{16S_{1}}{\pi} = 2$$
12. The value of  $\frac{48S_{2}}{\pi^{2}}$  is \_\_\_\_\_.  
Answer (01.50)
Sol.  $S_{2} = \int_{\frac{\pi}{8}}^{\frac{3\pi}{8}} \sin^{2} x |4x - \pi| dx$ 

$$= \int_{\frac{\pi}{8}}^{\frac{3\pi}{8}} 4 \sin^{2} x \left| x - \frac{\pi}{4} \right| dx$$
Let  $x - \frac{\pi}{4} = t \Rightarrow dx = dt$ 

$$S_{2} = \int_{-\frac{\pi}{8}}^{\frac{\pi}{8}} 4 \sin^{2} \left( \frac{\pi}{4} + t \right) |t| dt$$

$$= \int_{-\frac{\pi}{8}}^{\frac{\pi}{8}} (2 + 2 \sin 2t) |t| dt$$

$$= 2 \int_{-\frac{\pi}{8}}^{\frac{\pi}{8}} |t| dt + 2 \int_{-\frac{\pi}{8}}^{\frac{\pi}{8}} |t| \sin (2t) dt$$

$$= 4 \int_{0}^{\frac{\pi}{8}} t dt + 0$$

$$S_{2} = 2t^{2} \int_{0}^{\frac{\pi}{8}} = \frac{\pi^{2}}{32}$$

$$\Rightarrow \frac{48S_{2}}{\pi^{2}} = \frac{3}{2}$$

# SECTION - 3 (Maximum Marks : 12)

- This section contains TWO (02) paragraphs. Based on each paragraph, there are TWO (02) questions.
- Each question has FOUR options (A), (B), (C) and (D). ONLY ONE of these four options is the correct answer.
- For each question, choose the option corresponding to the correct answer.
- Answer to each question will be evaluated according to the following marking scheme:
- Full Marks : +3 If ONLY the correct option is chosen;
  - Zero Marks : 0 If none of the options is chosen (i.e. the question is unanswered);
- Negative Marks : -1 In all other cases.

### Paragraph

Let  $M = \{(x, y) \in R \times R : x^2 + y^2 \le r^2\}$ , where r > 0. Consider the geometric progression  $a_n = \frac{1}{2^{n-1}}$ , n = 1, 2, 3, .... Let  $S_0 = 0$  and, for  $n \ge 1$ , let  $S_n$  denote the sum of the first *n* terms of this progression. For  $n \ge 1$ , let  $C_n$  denote the circle with center  $(S_{n-1}, 0)$  and radius  $a_n$ , and  $D_n$  denote the circle with center  $(S_{n-1}, S_{n-1})$  and radius  $a_n$ .

13. Consider *M* with  $r = \frac{1025}{513}$ . Let *k* be the number of all those circles  $C_n$  that are inside *M*. Let *l* be the maximum

possible number of circles among these k circles such that no two circles intersect. Then

- (A) k + 2l = 22
- (B) 2k + l = 26
- (C) 2k + 3l = 34
- (D) 3k + 2l = 40

Answer (D)

**Sol.** : 
$$a_n = \frac{1}{2^{n-1}}$$
 and  $S_n = 2\left(1 - \frac{1}{2^n}\right)$ 

For circles  $C_n$  to be inside M.

$$S_{n-1} + a_n < \frac{1025}{513}$$

$$\Rightarrow S_n < \frac{1025}{513}$$

$$\Rightarrow 1 - \frac{1}{2^n} < \frac{1025}{1026} = 1 - \frac{1}{1026}$$

$$\Rightarrow 2^n < 1026$$

$$\Rightarrow n \le 10$$

 $\therefore$  Number of circles inside be 10 = K

Clearly alternate circles do not intersect each other *i.e.*,  $C_1$ ,  $C_3$ ,  $C_5$ ,  $C_7$ ,  $C_9$  do not intersect each other as well as  $C_2$ ,  $C_4$ ,  $C_6$ ,  $C_8$  and  $C_{10}$  do not intersect each other hence maximum 5 set of circles do not intersect each other.

- ∴ *I* = 5
- $\therefore \quad 3K+2I=40$
- .: Option (D) is correct

14. Consider *M* with  $r = \frac{(2^{199} - 1)\sqrt{2}}{2^{198}}$ . The number of all those circles  $D_n$  that are inside *M* is

(B) 199

(D) 201

(A) 198

(C) 200

Answer (B)

Sol. :: 
$$r = \frac{(2^{199} - 1)\sqrt{2}}{2^{198}}$$
  
Now,  $\sqrt{2} S_{n-1} + a_n < \left(\frac{2^{199} - 1}{2^{198}}\right)\sqrt{2}$   
 $2 \cdot \sqrt{2} \left(1 - \frac{1}{2^{n-1}}\right) + \frac{1}{2^{n-1}} < \left(\frac{2^{199} - 1}{2^{198}}\right)$ .  
:  $2\sqrt{2} - \frac{\sqrt{2}}{2^{n-2}} + \frac{1}{2^{n-1}} < 2\sqrt{2} - \frac{\sqrt{2}}{2^{198}}$   
 $\frac{1}{2^{n-2}} \left(\frac{1}{2} - \sqrt{2}\right) < -\frac{\sqrt{2}}{2^{198}}$   
 $\frac{2\sqrt{2} - 1}{2 \cdot 2^{n-2}} > \frac{\sqrt{2}}{2^{198}}$   
 $2^{n-2} < \left(2 - \frac{1}{\sqrt{2}}\right) 2^{197}$   
:  $n \le 199$   
: Number of circles = 199

Option (B) is correct.

### Paragraph

Let  $\psi_1 : [0, \infty) \to \mathbb{R}, \ \psi_2 : [0, \infty) \to \mathbb{R}, \ f : [0, \infty) \to \mathbb{R} \text{ and } g : [0, \infty) \to \mathbb{R}$  be functions such that f(0) = g(0) = 0,

$$\psi_1(x) = e^{-x} + x, \ x \ge 0,$$
  
$$\psi_2(x) = x^2 - 2x - 2e^{-x} + 2, \ x \ge 0,$$
  
$$f(x) = \int_{-x}^{x} (|t| - t^2) e^{-t^2} dt, \ x > 0$$
  
$$g(x) = \int_{0}^{x^2} \sqrt{t} e^{-t} dt, \ x > 0.$$

and

- 15. Which of the following statements is TRUE?
  - (A)  $f\left(\sqrt{\ln 3}\right) + g\left(\sqrt{\ln 3}\right) = \frac{1}{3}$
  - (B) For every x > 1, there exists an  $\alpha \in (1, x)$  such that  $\Psi_1(x) = 1 + \alpha x$
  - (C) For every x > 0, there exists a  $\beta \in (0, x)$  such that  $\Psi_2(x) = 2x (\Psi_1(\beta) 1)$
  - (D) *f* is an increasing function on the interval  $\left| 0, \frac{3}{2} \right|$

Answer (C)

Sol. 
$$\therefore g(x) = \int_{0}^{x^{2}} \sqrt{t} e^{-t} dt, x > 0$$
  
Let  $t = u^{2} \Rightarrow dt = 2u du$   
 $\therefore g(x) = \int_{0}^{x} u e^{-u^{2}} 2u du$   
 $= 2\int_{0}^{x} t^{2} e^{-t^{2}} dt$  ...(i)  
and  $f(x) = \int_{-x}^{x} (|t| - t^{2})e^{-t^{2}} dt, x > 0$   
 $\therefore f(x) = 2\int_{0}^{x} (t - t^{2})e^{-t^{2}} dt$  ...(ii)  
From equation (i) + (ii) :  $f(x) + g(x) = \int_{0}^{x} 2te^{-t^{2}} dt$   
Let  $t^{2} = P \Rightarrow 2t dt = dP$   
 $\therefore f(x) + g(x) = \int_{0}^{x^{2}} e^{-P} dP = [-e^{-P}]_{0}^{x^{2}}$   
 $\therefore f(x) + g(x) = 1 - e^{-x^{2}}$  ...(iii)  
 $\therefore f(\sqrt{\ln 3}) + g(\sqrt{\ln 3}) = 1 - e^{-\ln 3} = 1 - \frac{1}{3} = \frac{2}{3}$   
 $\therefore$  Option (A) is incorrect.  
From equation (ii) :  $f'(x) = 2(x - x^{2})e^{-x^{2}} = 2x(1 - x)e^{-x^{2}}$ 

- $\therefore$  f(x) is increasing in (0, 1)
- .: Option (D) is incorrect

$$:: \Psi_1(x) = e^{-x} + x$$

$$\Rightarrow \Psi'_{1}(x) = 1 - e^{-x} < 1 \text{ for } x > 1$$

Then for  $\alpha \in (1, x)$ ,  $\Psi_1(x) = 1 + \alpha x$  does not true for  $\alpha > 1$ .

... Option (B) is incorrect

Now 
$$\psi_2(x) = x^2 - 2x - 2e^{-x} + 2$$
  
 $\Rightarrow \psi'_2(x) = 2x - 2 + 2e^{-x}$ 

$$\therefore \quad \psi_2'(x) = 2\psi_1(x) - 2$$

From LMVT

$$\frac{\psi_2(x) - \psi_2(0)}{x - 0} = \psi_2'(\beta) \text{ for } \beta \in (\infty, x)$$
$$\Rightarrow \quad \psi_2(x) = 2x(\psi_1(\beta) - 1)$$

.:. Option (C) is correct.

- 16. Which of the following statements is TRUE?
  - (A)  $\Psi_1(x) \le 1$ , for all x > 0

(B)  $\Psi_2(x) \le 0$ , for all x > 0

(C) 
$$f(x) \ge 1 - e^{-x^2} - \frac{2}{3}x^3 + \frac{2}{5}x^5$$
, for all  $x \in \left(0, \frac{1}{2}\right)$  (D)  $g(x) \le \frac{2}{3}x^3 - \frac{2}{5}x^5 + \frac{1}{7}x^7$ , for all  $x \in \left(0, \frac{1}{2}\right)$ 

Answer (D)

- Sol. ::  $\Psi_1(x) = e^{-x} + x$ and for all x > 0,  $\Psi_1(x) > 1$ :. (A) is not correct  $\Psi_1(x) = x^2 + 2 - 2 (e^{-x} + x) > 0$  for x > 0:. (B) is not correct Now,  $\sqrt{t} e^{-t} = \sqrt{t} \left( 1 - \frac{t}{1!} + \frac{t^2}{2!} - \frac{t^3}{3!} + \dots \infty \right)$ and  $\sqrt{t} e^{-t} \le t^{\frac{1}{2}} - t^{\frac{3}{2}} + \frac{1}{2}t^{\frac{5}{2}}$ :.  $\int_0^{x^2} \sqrt{t} e^{-t} dt \le \int_0^{x^2} \left( t^{\frac{1}{2}} - t^{\frac{3}{2}} + \frac{1}{2}t^{\frac{5}{2}} \right) dt$   $= \frac{2}{3}x^3 - \frac{2}{3}x^5 + \frac{1}{7} + \frac{1}{7}x^7$ 
  - ... Option (D) is correct

and 
$$f(x) = \int_{-x}^{x} (|t| - t^2) e^{-t^2} dt$$
  

$$= 2 \int_{0}^{x} (t - t^2) e^{-t^2} dt$$

$$= \int_{0}^{x} 2t e^{-t^2} dt - 2 \int_{0}^{x} t^2 e^{-t^2} dt$$

$$= 1 - e^{-x^2} - 2 \int_{0}^{x} t^2 e^{-t^2} dt$$

$$\therefore \quad f(x) \le 1 - e^{-x^2} - 2 \int_{0}^{x} t^2 (1 - t^2) dt$$

$$= 1 - e^{-x^2} - 2 \frac{x^3}{3} + \frac{2}{5} x^5 \text{ for all } x \left(0, \frac{1}{2}\right)$$

$$\therefore \quad \text{Option (C) is incorrect.}$$

### **SECTION - 4 (Maximum Marks : 12)**

- This section contains THREE (03) questions.
- The answer to each question is a **NON-NEGATIVE INTEGER**.
- For each question, enter the correct integer corresponding to the answer using the mouse and the on-screen virtual numeric keypad in the place designated to enter the answer.
- Answer to each question will be evaluated according to the following marking scheme:

Full Marks	:	+4	If ONLY the correct integer is entered

Zero Marks : 0 In all other cases.

17. A number is chosen at random from the set {1, 2, 3....., 2000}. Let *p* be the probability that the number is a multiple of 3 or a multiple of 7. Then the value of 500*p* is \_\_\_\_\_.

### Answer (214)

**Sol.** *E* = *a* number which is multiple of 3 or multiple of 7

$$n(E) = (3, 6, 9, \dots, 1998) + (7, 14, 21, \dots, 1995) - (21, 42, 63, \dots, 1995)$$

- n(E) = 666 + 285 95
- n(E) = 856
- n(E) = 2000
- $P(E) = \frac{856}{2000}$

$$P(E) \times 500 = \frac{856}{4} = 214$$

18. Let *E* be the ellipse  $\frac{x^2}{16} + \frac{y^2}{9} = 1$ . For any three distinct points *P*, *Q* and *Q'* on *E*, let M (*P*, *Q*) be the mid-point

of the line segment joining P and Q, and M(P, Q') be the mid-point of the line segment joining P and Q'. Then the maximum possible value of the distance between M(P, Q) and M(P, Q'), as P, Q and Q' vary on E, is \_\_\_\_\_.

Sol. Let 
$$P(\alpha)$$
,  $Q(\theta)$ ,  $Q'(\theta')$   

$$M = \frac{1}{2} (4\cos\alpha + 4\cos\theta), \ \frac{1}{2} (3\sin\alpha + 3\sin\theta)$$

$$M' = \frac{1}{2} (4\cos\alpha + 4\cos\theta'), \ \frac{1}{2} (3\sin\alpha + 3\sin\theta')$$

$$MM' = \frac{1}{2} \sqrt{(4\cos\theta - 4\cos\theta')^2 + (3\sin\theta - 3\sin\theta')^2}$$

$$MM' = \frac{1}{2} \text{ distance between } Q \text{ and } Q'$$

$$MM' \text{ is not depending on } P$$
Maximum of  $QQ'$  is possible when  $QQ'$  = major axis  
 $QQ' = 2(4) = 8$ 

$$MM' = \frac{1}{2} \cdot (QQ')$$

MM' = 4

19. For any real number x, let [x] denote the largest integer less than or equal to x. If  $I = \int_{0}^{10} \left[ \sqrt{\frac{10x}{x+1}} \right] dx$ , then the

	value of 9/ is		_·		
Answ	ver (182.00)				
Sol.	$I = \int_{0}^{10} \left[ \sqrt{\frac{10x}{x+1}} \right] c$	lx			
	$y=\frac{10x}{x+1}$ ,	0 ≤	<i>x</i> ≤ 10	)	
	xy + y = 10x				
	$x=\frac{y}{10-y}$				
	$0 \le \frac{y}{10-y} \le 10$				
	$\frac{y}{10-y} \ge 0$	and		<u>у</u> 10 –	$\frac{1}{y}$ - 10 $\leq$ 0
	$\frac{y}{y-10} \le 0$	and		<u>11y</u> y-	$\frac{-100}{-10} \ge 0$
	+ <u>-</u> + 0 10	and	$\frac{+}{100}$	 	+)
	y ∈ [0, 10)	and		<b>y</b> ∈	$-\infty, \frac{100}{11} \bigg] \cup (10, \infty)$
	$y \in \left[0, \frac{100}{11}\right]$				
	$\sqrt{y} \in \left[0, \frac{10}{\sqrt{11}}\right]$			$\Rightarrow$	$\left[\sqrt{y}\right] = \left\{0, 1, 2, 3\right\}$

**Cose I** :  $0 \le \frac{10x}{x+1} < 1$ 

$$\frac{10x}{x+1} \ge 0 \quad \text{and} \quad \frac{10x}{x+1} - 1 < 0$$

$$\frac{+}{-1} - \frac{+}{0} \quad \text{and} \quad \frac{9x-1}{x+1} < 0$$

$$\frac{+}{-1} - \frac{+}{1} - \frac{+}{1} = 0$$

$$x \in (-\infty, -1) \cup [0, \infty) \quad \text{and} \quad x \in \left(-1, \frac{1}{9}\right)$$

$$x \in \left[0, \frac{1}{9}\right] \quad \text{then} \quad \left[\sqrt{\frac{10x}{x+1}}\right] = 0$$

Case II: 
$$1 \le \frac{10x}{x+1} < 4$$
  

$$\frac{10x}{x+1} - 1 \ge 0 \quad \text{and} \quad \frac{10x}{x+1} - 4 < 0$$

$$\frac{9x-1}{x+1} \ge 0 \quad \text{and} \quad \frac{6x-4}{x+1} < 0$$

$$\frac{+}{-1} \quad \frac{-}{1} \quad \frac{+}{9} \quad \text{and} \quad \frac{+}{-1} \quad \frac{-}{+2} \quad \frac{+}{3}$$

$$x \in (-\infty, -1) \cup \left[\frac{1}{9}, \infty\right] \quad \text{and} \quad x \in \left(-1, \frac{2}{3}\right)$$

$$x \in \left[\frac{1}{9}, \frac{2}{3}\right] \quad , \quad \left[\sqrt{\frac{10x}{x+1}}\right] = 1$$
Case III:  $4 \le \frac{10x}{2} < 9$ 

**Case III** :  $4 \le \frac{10x}{x+1} < 9$ 

$$\frac{10x}{x+1} - 4 \ge 0 \quad \text{and} \quad \frac{10x}{x+1} < 9$$

$$\frac{6x-4}{x+1} \ge 0 \quad \text{and} \quad \frac{x-9}{x+1} < 0$$

$$\frac{+}{-1} - \frac{+}{2} \quad \text{and} \quad \frac{+}{-1} - \frac{+}{9}$$

$$x \in (-\infty, -1) \cup \left[\frac{2}{3}, \infty\right] \quad x \in (-1, -1)$$

9)

$$x \in \left[\frac{2}{3}, 9\right)$$
;  $\left[\sqrt{\frac{10x}{x+1}}\right] = 2$ 

**Case IV** :  $x \in [9, 10] \implies \left[\sqrt{\frac{10x}{x+1}}\right] = 3$ 

$$I = \int_{0}^{\frac{1}{9}} 0 \cdot dx + \int_{\frac{1}{9}}^{\frac{2}{3}} 1 \cdot dx + \int_{\frac{2}{3}}^{9} 2 \cdot dx + \int_{9}^{10} 3 \cdot dx$$
$$I = \left(\frac{2}{3} - \frac{1}{9}\right) + 2\left(9 - \frac{2}{3}\right) + 3(10 - 9)$$
$$I = \frac{5}{9} + \frac{50}{3} + 3$$
$$9I = 182$$
